Gondola Dumping System eliminates the costly problems of traditional dumping systems

Carpenter Crane Hoist has developed a gondola dumping system that is designed to reduce the damaging effects of side-loading and shock-loading with traditional dumping systems. Carpenter Crane Hoist uses a dual floating trolley with a shock absorber and clutch drive to help eliminate the costly problems of traditional systems.

Gondola Dump System installed at Heitz Winery, Napa, CA

Features of Gondola Dumping System

- Systems are low impact with dampener trolleys that eliminate shock-loading of the hoist
- Hoist reduces damage through minimal side loading
- Electric chain hoists instead of wire rope reduce initial costs as well as maintenance
- Dump systems have low maintenance costs, and less down time due to damage from shock and side-loading

The inverter drive controls are very versatile; They allow the operation to adjust to the speed of the trolley.

System is being used in the single function continuous dump mode.
